## **VIDAR SUPERIOR**

Vidar Superior belongs to the new generation of modified H11 (1.2343) steel grades with a low silicon content. The steel is produced using the very latest in production techniques and shows very high toughness values.

Vidar Superior is tested and certified, providing the customer the best possible performance. Suitable applications are those where a High toughness is needed; like in die casting or forging. The high purity in Vidar Superior makes it an excellent steel also in plastic applications.

### **IMPROVED TOOLING PERFORMANCE**

The name "Superior" implies that by special processing techniques and close process control, the steel attains high purity and a very fine structure. Vidar Superior shows significant improvements in impact toughness compared to material of the H11 (W.-Nr. 1.2343) type.

The improved impact toughness is particularly valuable for tooling subjected to high mechanical and thermal stresses, e.g. die casting dies and forging tools. In practical terms, tools may be used at Somewhat higher working hardness (2 HRC) without loss of toughness. Since increased service hardness limits the formation of thermal fatigue cracks, improved tool performance can be expected.

## GENERAL

Vidar Superior is a chromium-molybdenumvanadium alloyed hot work tool steel which is characterised by:

- High level of resistance to thermal shock and thermal fatigue
- Good high-temperature strength
- Excellent toughness and ductility in all directions
- Excellent through-hardening properties
- Good dimensional stability during hardening

## PROPERTIES

### PHYSICAL DATA

All specimens are taken from the centre of a 1000  $\times$  200 mm bar. Unless otherwise is indicated all specimens were hardened from 1000°C, quenched in a vacuum furnace and tempered 2 + 2h at 600°C to 45 ±1 HRC.

### EFFECT OF TIME AT HIGH TEMPERATURES ON HARDNESS

Hardness, HRC

## EFFECT OF TESTING TEMPERATURES ON IMPACT ENERGY

Charpy V specimens, short transverse direction.

Impact energy, J 120 100 80 60 40 20 -40 -20 20 100 200 300 400 500°C

#### Testing temperature

### **HEAT TREATMENT**

### SOFT ANNEALING

Protect the steel and heat through to 850  $^{\circ}$ C. Then cool in the furnace at 10  $^{\circ}$ C per hour to 650  $^{\circ}$ C, then freely in air.

### **STRESS RELIEVING**

After rough machining, the tool should be heated through to 650  $^{\circ}$ C and holding time 2 hours. Cool slowly to 500  $^{\circ}$ C, then freely in air.

### HARDENING

Preheating temperature: 600 - 900 °C. Minimum two preheating steps at 600-650 °C and 820-850 °C. When three preheats are used the second is carried out at 820 °C and the third at 900 °C

Austenitising temperature: 980 - 1010 °C.

Soaking time: 30 - 45 minutes

Soaking time = time at austenitising temperature after the tool is fully heated through.

Protect the tool against decarburisation and oxidation during austenitising.

### **QUENCHING MEDIA**

- High speed gas / circulating atmosphere.
- Vacuum (high speed gas with sufficient positive pressure). An interrupted quench at 350-450°C is recommended where distortion control and quench cracking are a concern,
- Martempering bath (salt or fluidised bed) at 500-550°C or 180-220°C.
- Warm oil, approx. 80°C

Note 1 : Temper the tool as soon as its temperature reaches 50 – 70  $^\circ\text{C}.$ 

Note 2 : In order to obtain the optimum properties for the tool, the cooling rate should be as fast, but not at a level that gives excessive distortion or cracks.

### **CCT GRAPH**

### Austenitising temperature 1000°C. Holding time 30 minutes.

### TEMPERING

Choose the tempering temperature according to the hardness required by reference to the tempering graph. Temper minimum twice with intermediate cooling to room temperature. Holding time at

temperature is minimum 2 hours. Tempering in the temperature range 450-550°C for the intended final hardness will result in a lower toughness.

#### **TEMPERING GRAPH**

Air cooling of specimen 15 x 15 x 40 mm

Above tempering curves are obtained after heat treatment of samples with a size of  $15 \times 15 \times 40$  mm, cooling in forced air. Lower hardness can be expected after heat treatment of tools and dies due to factors like actual tool size and heat treatment parameters.

## HARDNESS, GRAIN SIZE AND RETAINED AUSTENITE AS A FUNCTION OF AUSTENITISING TEMPERATURE

### APPROXIMATE IMPACT ENERGY AT DIFFERENT TEMPERING TEMPERATURES

### Charpy V specimens, short transverse direction. Impact energy KV Joule

### DIMENSIONAL CHANGES DURING HARDENING AND TEMPERING

During hardening and tempering the die is exposed to thermal as well as transformation stresses. This will inevitably result in dimensional changes and in the work case distortion. It is therefore recommended to always leave a machining allowance after machining before the die is hardened and tempered. Normally the size in the largest direction will shrink and the size Tempering in the temperature range 450–550°C for the intended final hardness will result in a lower toughness.

Charpy U specimens, short transverse direction.

in the smallest direction might increase but this is also a matter of the die size, the die design as well as the cooling rate after hardening.

For Vidar Superior, it is recommended to leave a machining allowance of 0.2 per cent of the dimension in length, width and thickness.

### NITRIDING AND NITROCARBURISING

Nitriding and nitrocarburising result in a hard surface layer which is very resistant to wear and erosion. The nitrided layer is, however, brittle and my crack or spall when exposed to mechanical or thermal shock, the risk increasing with layer thickness. Before nitriding, the tool should be hardened and tempered at a temperature at least 50°C above the nitriding temperature.

Nitriding in ammonia gas at  $510^{\circ}$ C or plasma nitriding in 75% hydrogen / 25% nitrogen at 480°C both result in a surface hardness of ~1100 HV<sub>02</sub>.

In general, plasma nitriding is the preferred method because of better control over nitrogen potential; in particular, formation of the so-called "white layer", which is not recommended for hot-work service, can readily be avoided. However, careful gas nitriding can give perfectly acceptable results.

Vidar Superior can also be nitrocarburised in either gas or salt bath. The surface hardness after nitrocarburising is 1000–1100  $HV_{0.2}$ .

| Process                   |        | Depth |
|---------------------------|--------|-------|
| Frocess                   | Time   | mm    |
| Cas mismiding of 510°C    | 10 h   | 0.12  |
| Gas nitriding at 510°C    | 30 h   | 0.21  |
|                           | 10 h   | 0.10  |
| Plasma hitriding at 480°C | 30 h   | 0.19  |
| Nitrocarburising          |        |       |
| - in gas at 580°C         | 2.5 hr | 0.13  |
| - in salt bath at 580°C   | 1 hr   | 0.07  |

### DEPTH OF NITRIDING

\* Depth of case = distance from surface where hardness is 50  $\mathrm{HV}_{_{0,2}}$  over base hardness

Vidar Superior can also be nitrided in the soft annealed condition. The hardness and depth of case will, however, be reduced somewhat in this case.

### MACHINING RECOMMENDATIONS

The cutting data below are to be considered as guiding values which must be adapted to existing local conditions.

### TURNING

### **END MILLING**

|  | Type of milling           |                                |                           |  |
|--|---------------------------|--------------------------------|---------------------------|--|
| Cutting data<br>parameters             | Solid carbide             | Carbide<br>indexable<br>insert | High speed<br>steel       |  |
| Cutting speed (v <sub>c</sub> ), m/min | 145 – 185                 | 150 – 190                      | 30 – 35 <sup>1)</sup>     |  |
| Feed (f <sub>z</sub> )<br>mm/tooth     | 0.03 – 0.20 <sup>2)</sup> | 0.08 – 0.20 <sup>2)</sup>      | 0.05 – 0.35 <sup>2)</sup> |  |
| Carbide<br>designation<br>ISO          | _                         | P10 – P20                      | _                         |  |

1) For coated High Speed Steel end mill,  $v_c\sim 50-55$  m/min 2) Depending on radial depth of cut and cutter diameter

### DRILLING

### HIGH SPEED STEEL TWIST DRILL

| Drill diameter<br>mm | Cutting speed (v <sub>c</sub> )<br>m/min | Feed (f)<br>mm/r |
|----------------------|--|------------------|
| ≤5                   | 15 – 20*                                 | 0.05 – 0.10      |
| 5 – 10               | 15 – 20*                                 | 0.10 - 0.20      |
| 10 – 15              | 15 – 20*                                 | 0.20 – 0.25      |
| 15 – 20              | 15 – 20*                                 | 0.25 – 0.30      |

 $\ast$  For coated high speed steel drill,  $v_{_{\rm C}}\!\sim35-40$  m/min

### **CARBIDE DRILL**

| Cutting data<br>parameters                | Type of drill             |                  |                              |  |
|---|---------------------------|------------------|------------------------------|--|
|   | Indexable<br>insert       | Solid<br>carbide | Carbide<br>tip <sup>1)</sup> |  |
| Cutting speed<br>(v <sub>c</sub> ), m/min | 200 – 230                 | 120 – 150        | 120 – 150                    |  |
| Feed (f)<br>mm/r                          | 0.05 – 0.15 <sup>2)</sup> | 0.10 - 0.25 3)   | 0.15 – 0.25 <sup>4)</sup>    |  |

1) Drill with replaceable or brazed carbide tip

2) Feed rate for drill diameter 20-40 mm

3) Feed rate for drill diameter 5–20 mm

4) Feed rate for drill diameter 10-20 mm

### GRINDING

A general grinding wheel recommendation is given below. More information can be found in the publication "Grinding of tool steel".

| Type of grinding             | Soft annealed | Hardened |
|------------------------------|---------------|----------|
| Face grinding straight wheel | A 46 HV       | A 46 HV  |
| Face grinding segments       | A 24 GV       | A 36 GV  |
| Cylindrical grinding         | A 46 LV       | A 60 KV  |
| Internal grinding            | A 46 JV       | A 60 IV  |
| Profile grinding             | A 100 IV      | A 120 JV |

## ELECTRICAL DISCHARGE MACHINING — EDM

Following the EDM process, the applicable die surfaces are covered with a re-solidified layer (white layer) and a rehardened and untempered layer, both of which are very brittle and hence detrimental to die performance.

If EDM is used the white layer must be completely removed mechanically by grinding or stoning. After the finish machining the tool should also then be given an additional temper at approx. 25°C below the highest previous tempering temperature.

## POLISHING

Vidar Superior has good polishability in the hardened and tempered condition because of a very homogeneous structure. This coupled with a low level of non metallic inclusions, due to ESR process, ensures good surface finish after polishing.

Note: Each steel grade has an optimum polishing time which largely depends on hardness and polishing technique. Over polishing can lead to a poor surface finish, "orange peel" or pitting.

Further information is given in the publication "Polishing of mould steel".

## PHOTOETCHING

Vidar Superior is particularly suitable for texturing by the photoetching method. Its high level of homogeneity and low sulphur content ensures accurate and consistent pattern reproduction.

## WELDING

Welding of die components can be performed, With acceptable results, as long as the proper precautions are taken during the preparation of the joint, the filler material selection, the preheating of the die, the controlled cooling of the die and the post weld heat treatment processes. The following guidelines summarize the most important welding process parameters.

| Welding Method                      | TIG  | MMA                        |  |  |
|-------------------------------------|--|----------------------------|--|--|
| Preheating<br>temperature           | Min. 325°C   | Min. 325°C                 |  |  |
| Filler metals                       | DIEVAR TIG-WELD<br>QRO 90 TIG-WELD   | UTP 673<br>QRO 90 WELD     |  |  |
| Maximum<br>interpass<br>temperature | 475°C  | 475°C                      |  |  |
| Post welding cooling                | 20 - 40°C/hr for the first 2-3 hours and then freely in air.   |                            |  |  |
| Hardness after<br>welding           | 48 - 53 HRC  | 55 - 58 HRC<br>48 - 53 HRC |  |  |
| Heat treatment after welding        |  |                            |  |  |
| Hardened condition                  | Temper at 10-20 oC below the highest previous tempering temperature.   |                            |  |  |
| Soft annealed condition             | Soft anneal the material at 850°C in<br>protected atmosphere.<br>Then cool in the furnace at 10°C per<br>hour to 650°C then freely in air. |                            |  |  |

\* Preheating temperature must be established throughout the die and must be maintained for the entirety of the welding process, to prevent weld cracking.

## FURTHER INFORMATION

For further information, i.e., steel selection, heat treatment, application and availability, please contact our ASSAB office nearest to you.

# ASSAB SUPERIOR TOOLING SOLUTIONS A ONE-STOP SHOP

ASSAB is unmatched as a one-stop product and service provider that offers superior tooling solutions. In addition to the supply of tool steel and other special steel, our range of comprehensive valueadded services, such as machining, heat treatment and coating services, span the entire supply chain to ensure convenience, accountability and optimal usage of steel for customers. We are committed to achieving solutions for our customers, with a constant eye on time-to-market and total tooling economy.

Choosing the right steel is of vital importance. ASSAB engineers and metallurgists are always ready to assist you in your choice of the optimum steel grade and the most suitable treatment for each application. ASSAB not only supplies steel products with superior quality, but we also offer state-of-the-art machining, heat treatment, surface treatment services and additive manufacturing (3D printing) to enhance your tooling performance while meeting your requirements in the shortest lead time. Using a holistic approach as a one-stop solution provider, we are more than just another tool steel supplier.

In Asia Pacific, ASSAB anchors the distribution network for Uddeholm, a Swedish tool steel manufacturer with more than 350 years of experience in the tool steel industry. The two companies together service leading multinational companies (MNCs) in more than 90 countries.
